Agile Team Leader Responsibilities Snapshot (SAMPLE)

The snapshot on the next page shows an ATL (a former business analyst) who leads a delivery team of nine full-time programmers and testers. All nine report to functional managers. Three are experienced veterans who are frequently requested to provide temporary assistance to other teams and to managers. The product owner is generally available for backlog management and occasional questions, but rarely more than that; she struggles to translate between small-scale iteration-level progress and overall objectives. This is the first team out of a possible six to adopt Agile in the company, so senior managers are paying extra attention to the goings-on. The team works on an established Java platform with an “average” level of technical debt and dependencies on other teams. Team members sit in high-partition cubicles and although they are friendly and professional with each other, they have no history of significant collaboration. Agile sounds like a good idea to them, but they are not fired up about it.
